

Ten-Kilometer Vertical Moho Offset and Shallow Velocity Contrast Along the Denali Fault from Double-difference Tomography, Receiver Functions, and Fault Zone Head Waves

– Yehuda Ben-Zion
– Vera Schulte-Pelkum
– Carl Tape
– Zachary Ross
– Fan-Chi Lin

Outline

- Denali Fault Head Waves
- Denali Double-difference Tomography
- Central Alaska Receiver Functions

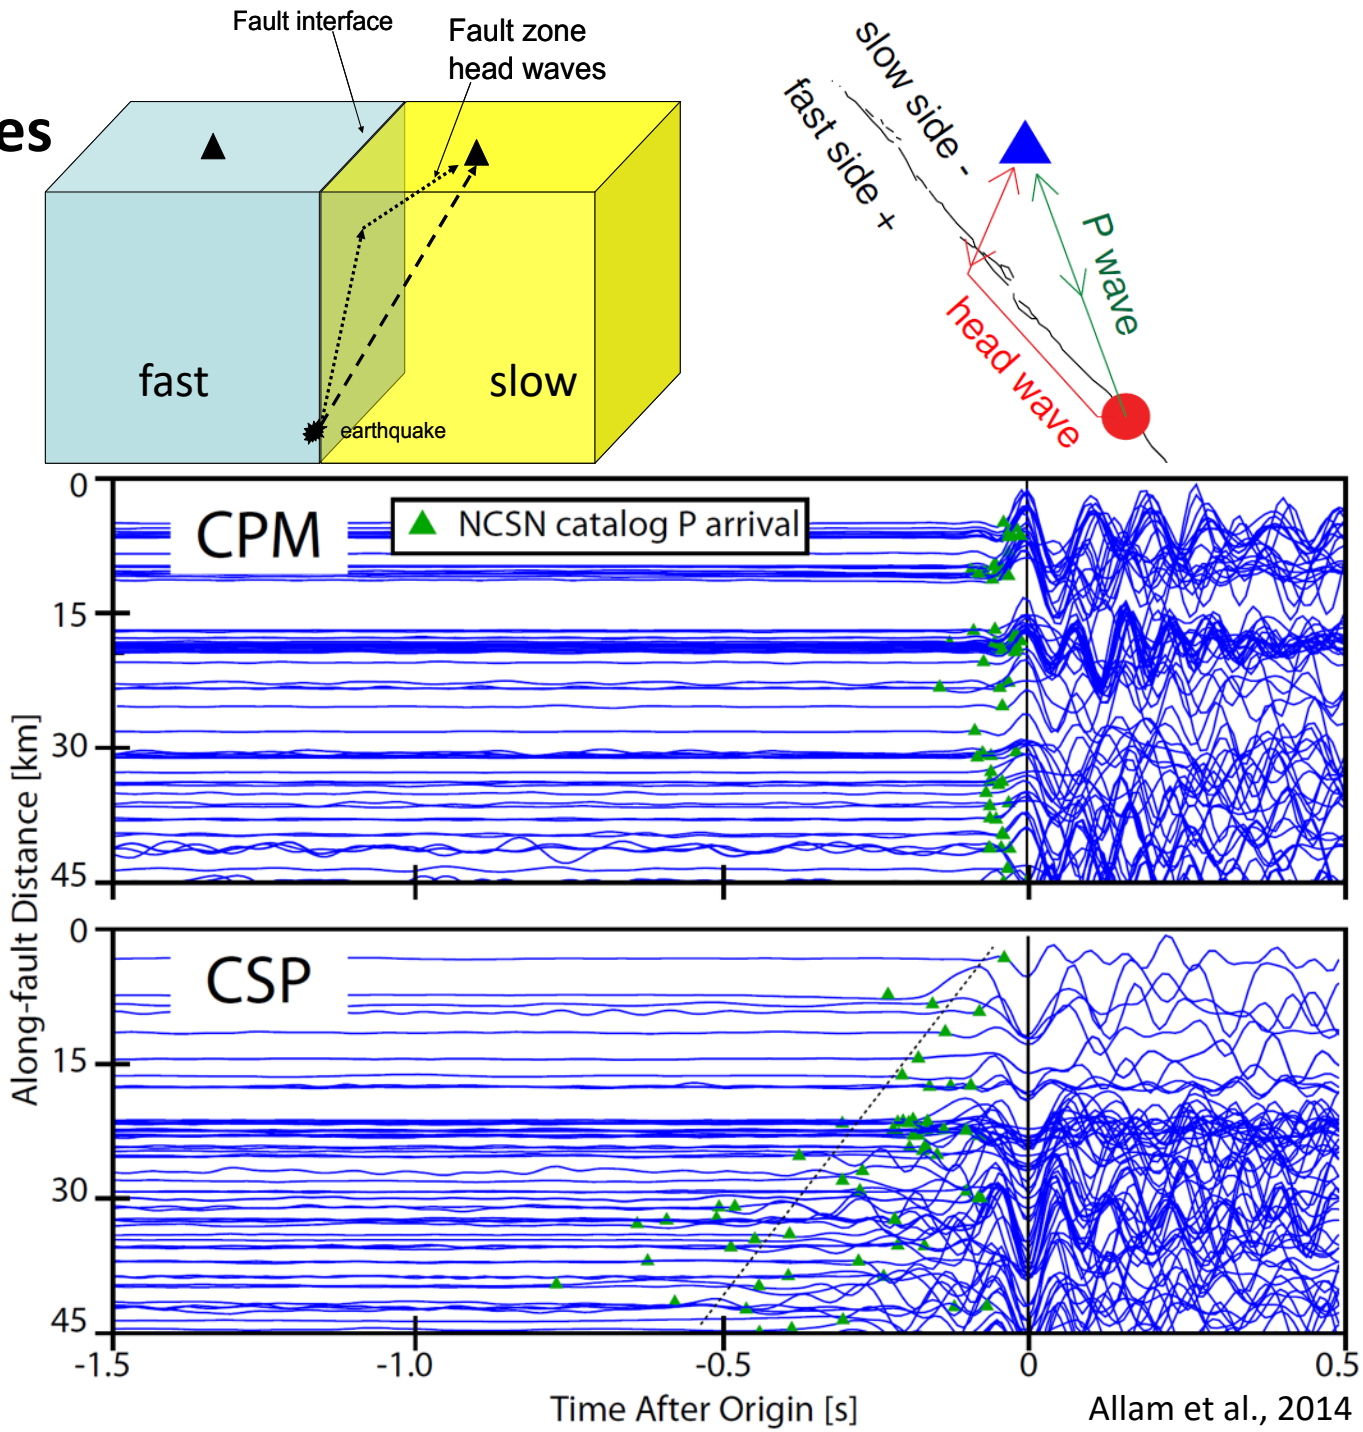

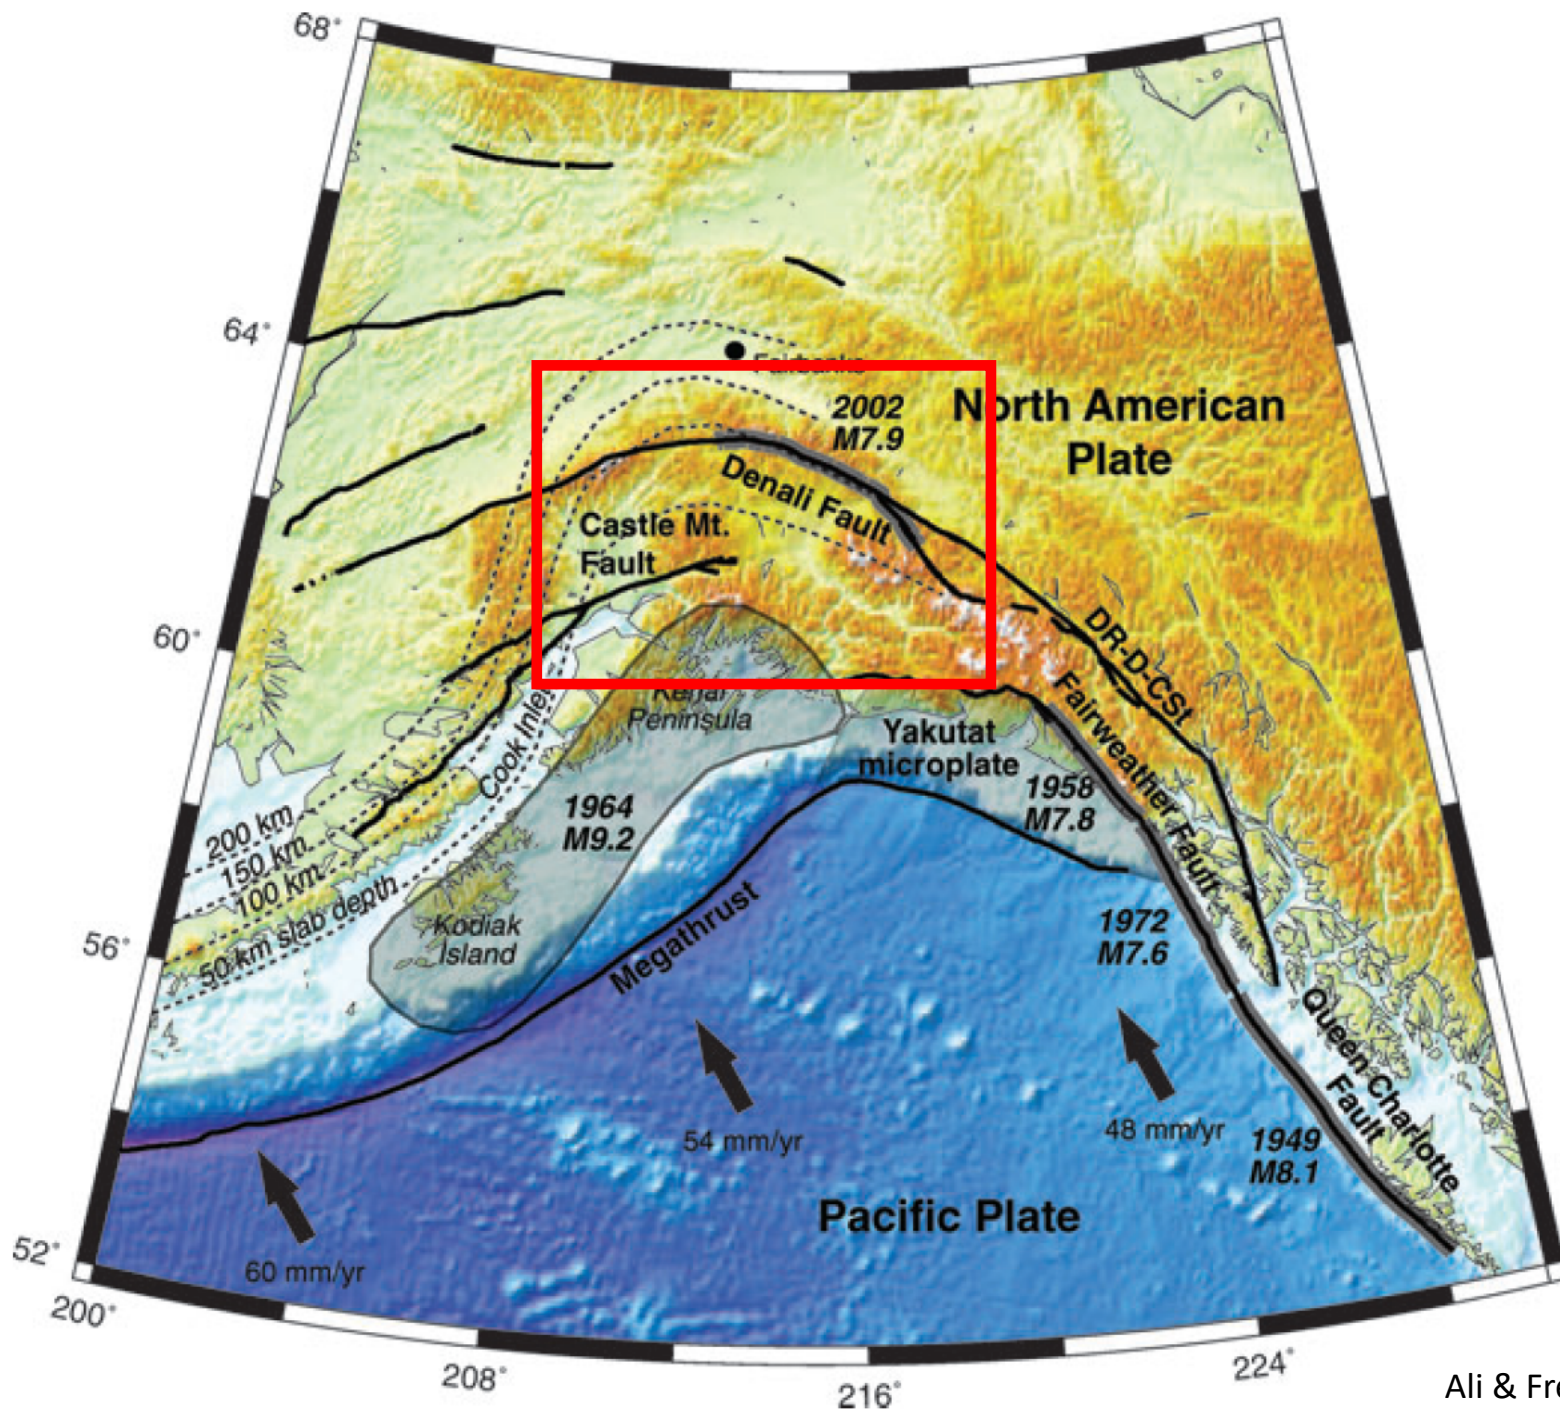

Head waves

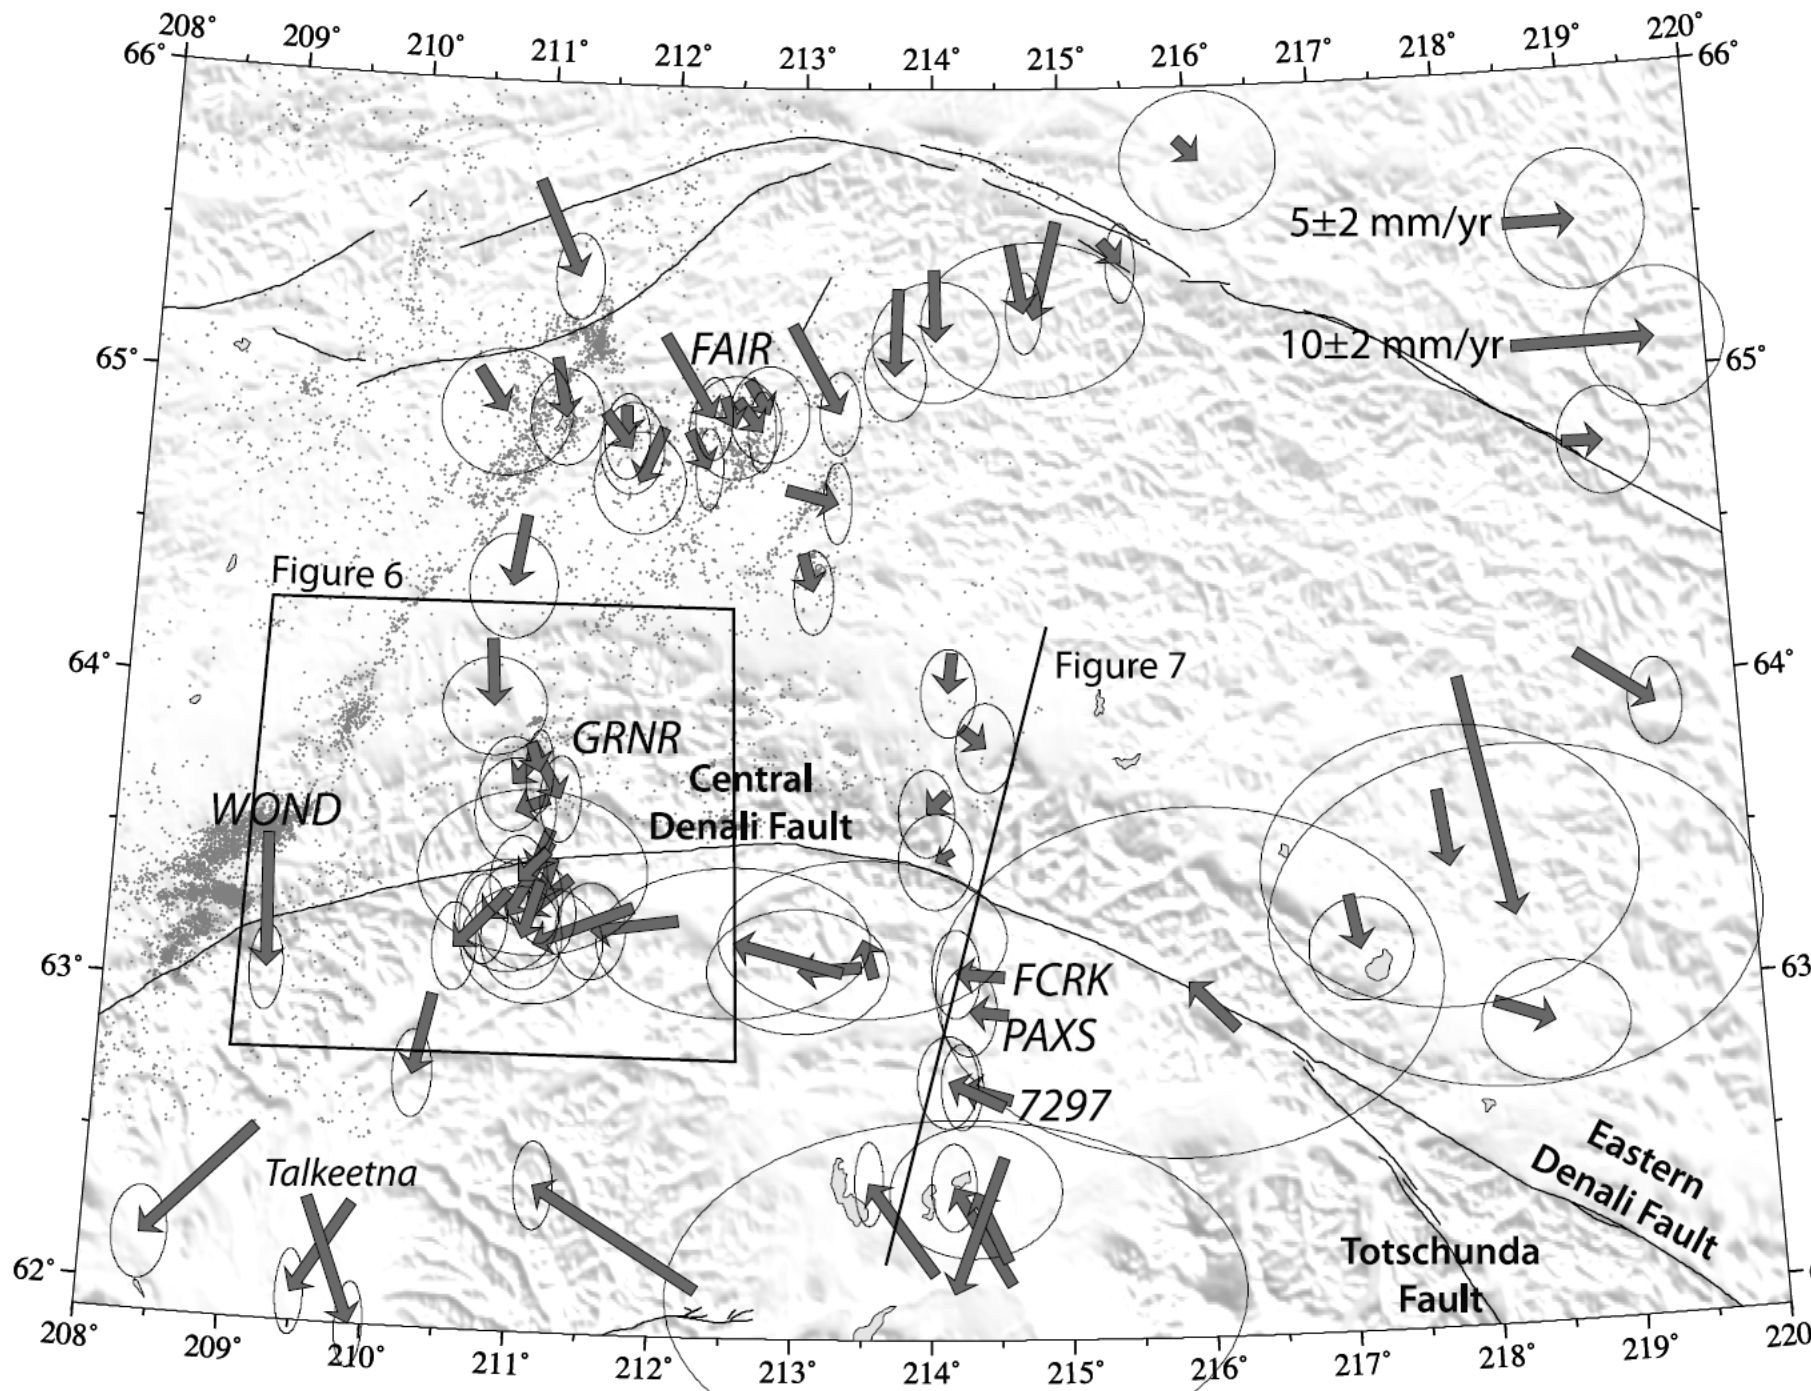

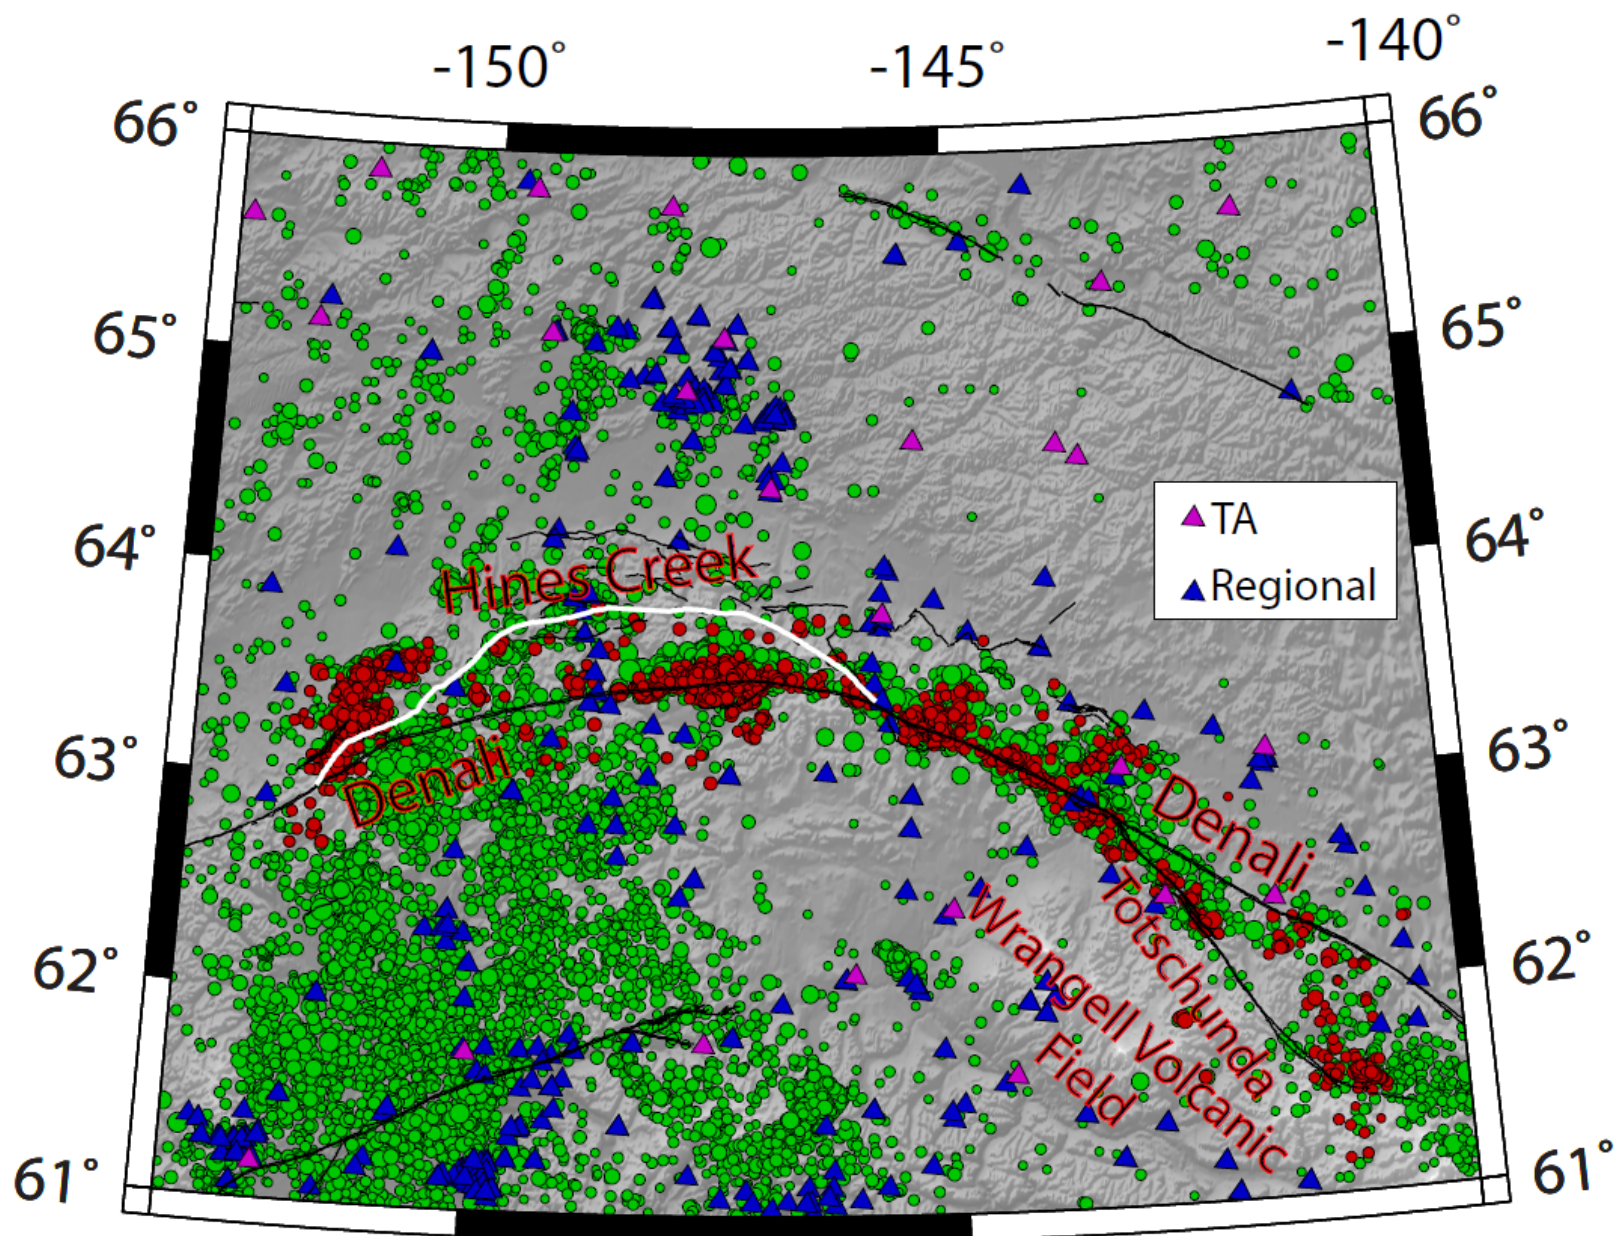

<http://web.utah.edu/thorne>

Fault Zone Head Waves

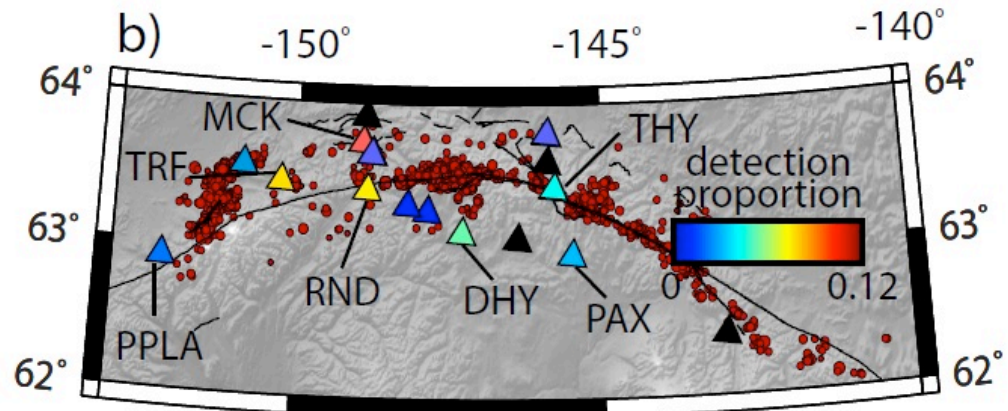

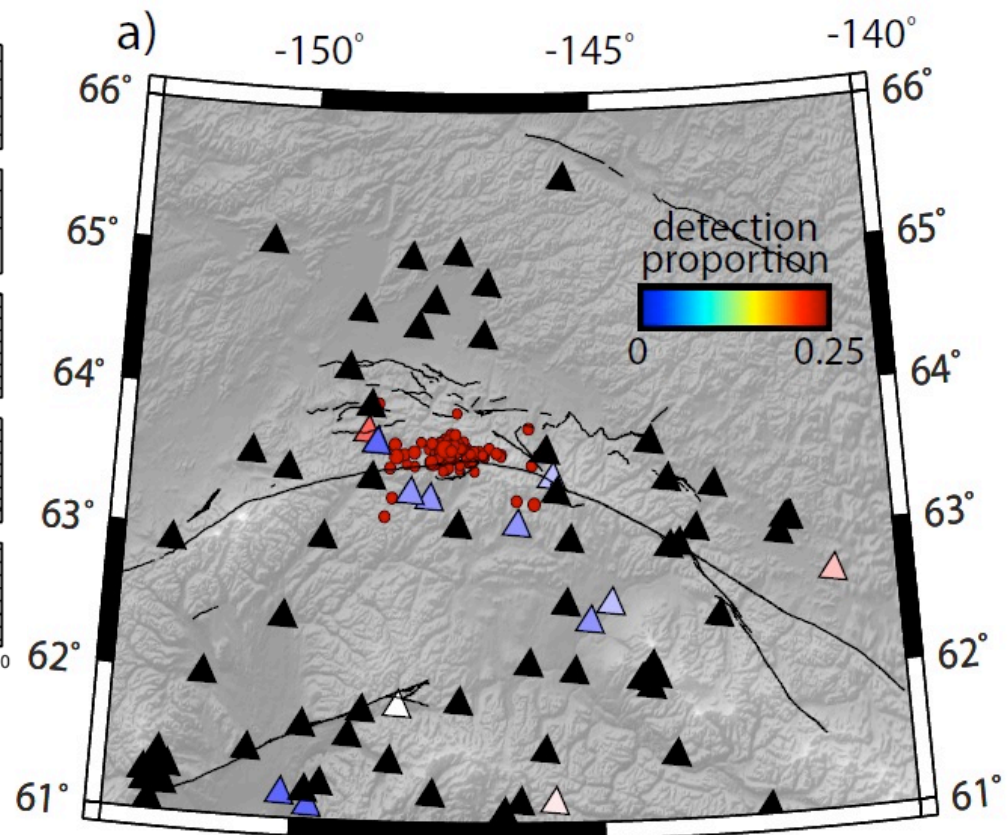

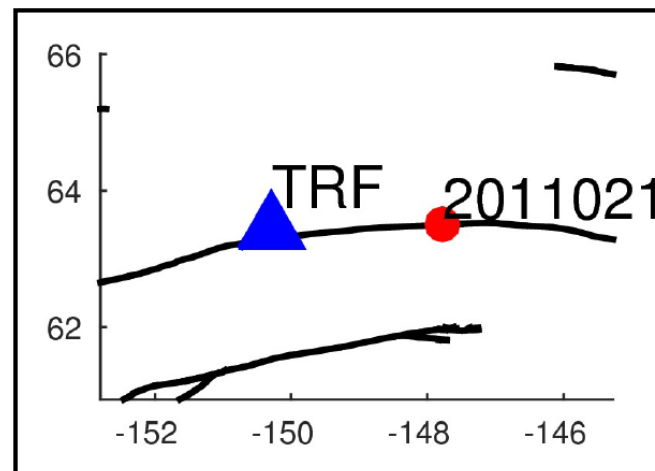

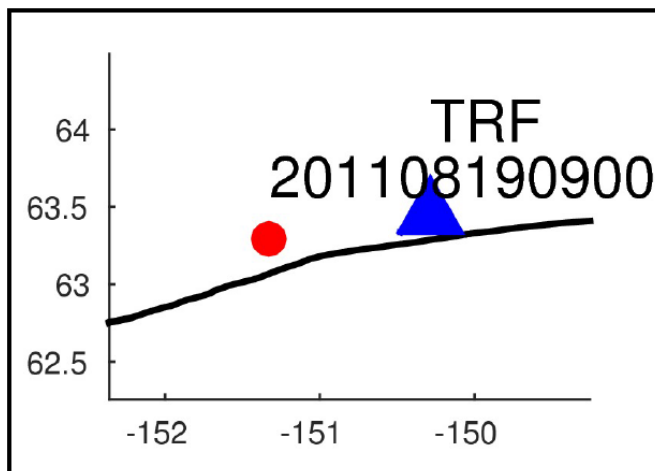

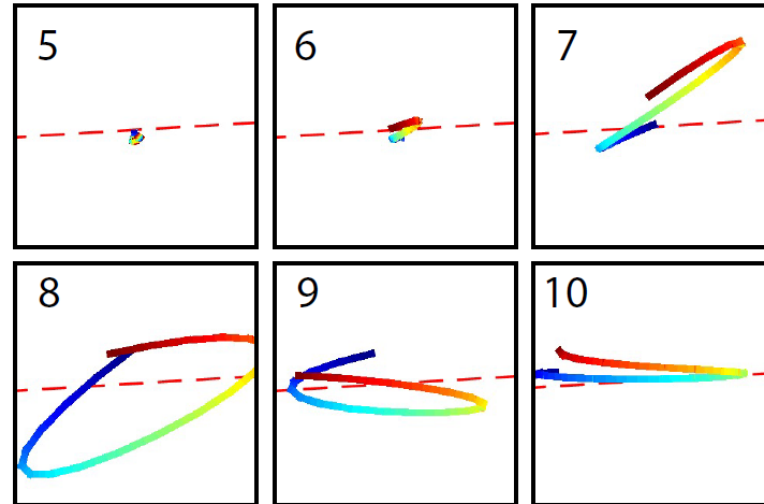

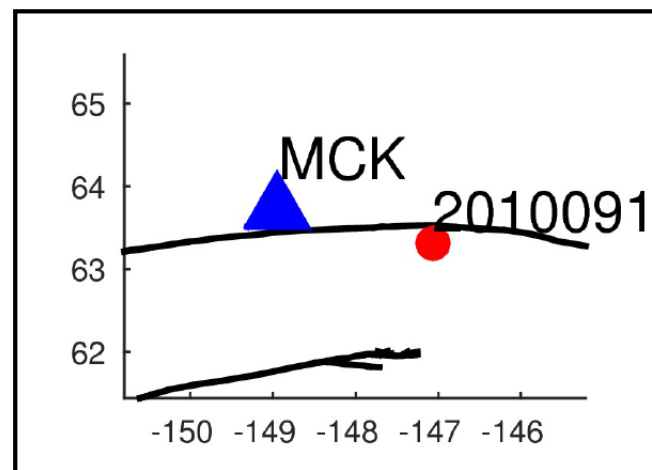

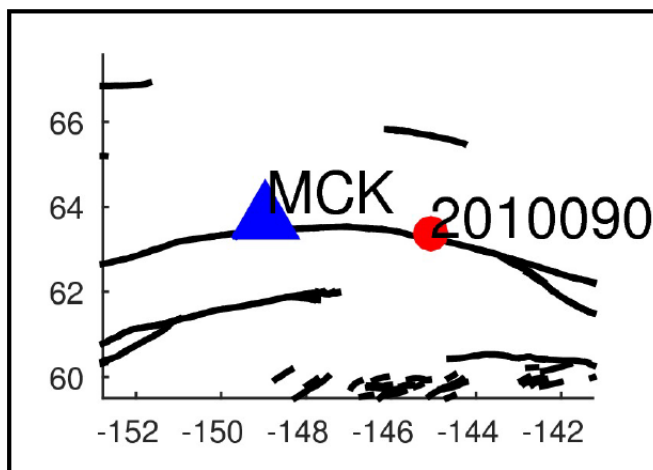

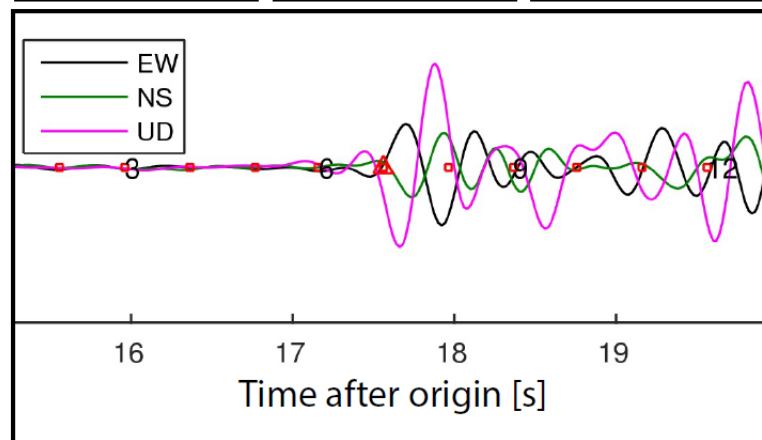

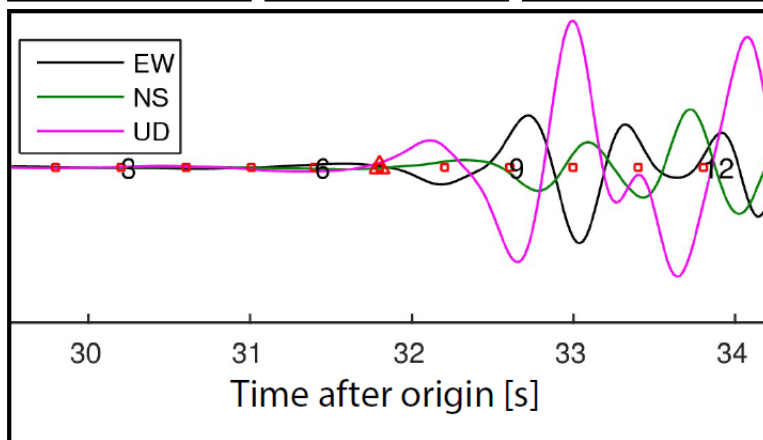

Denali Fault Head Waves

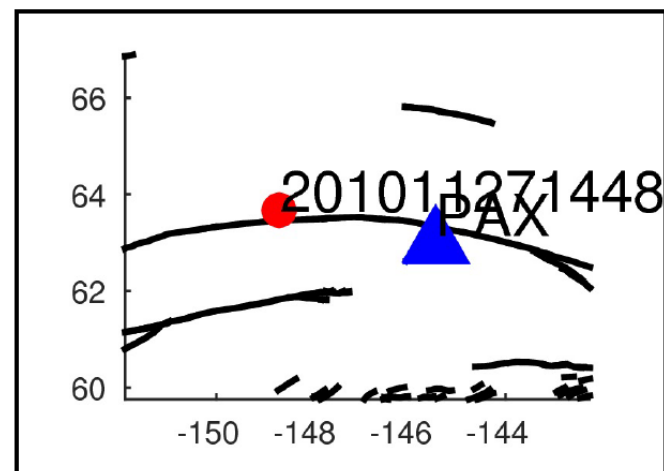

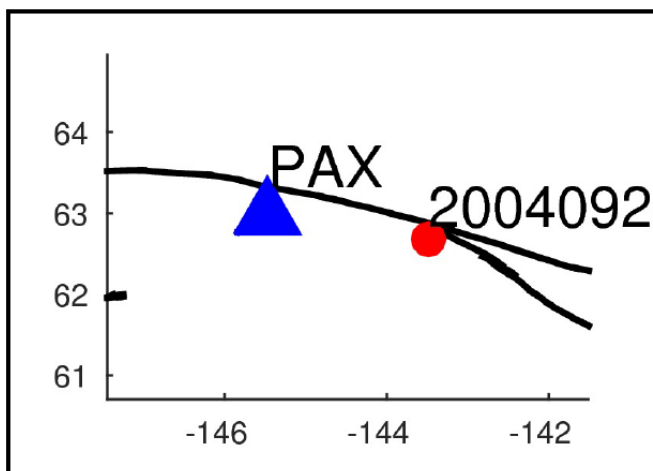

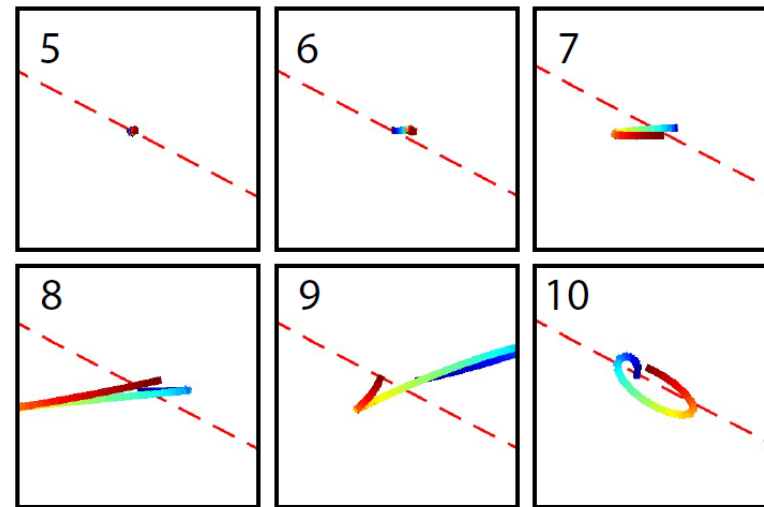

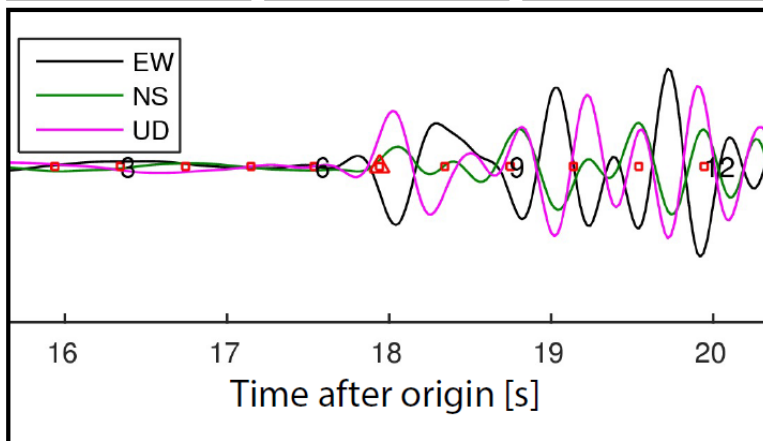

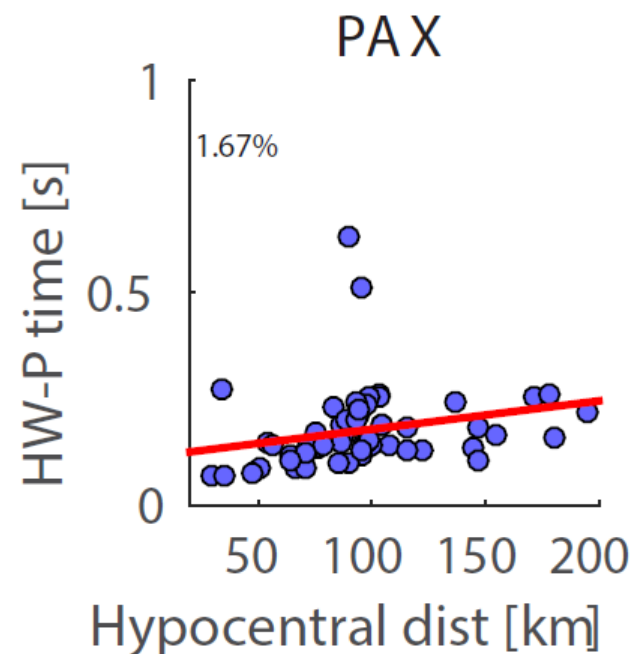

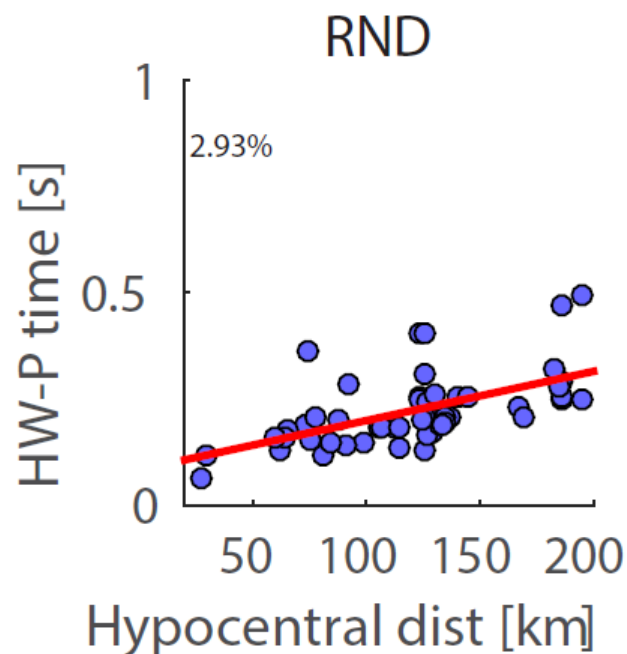

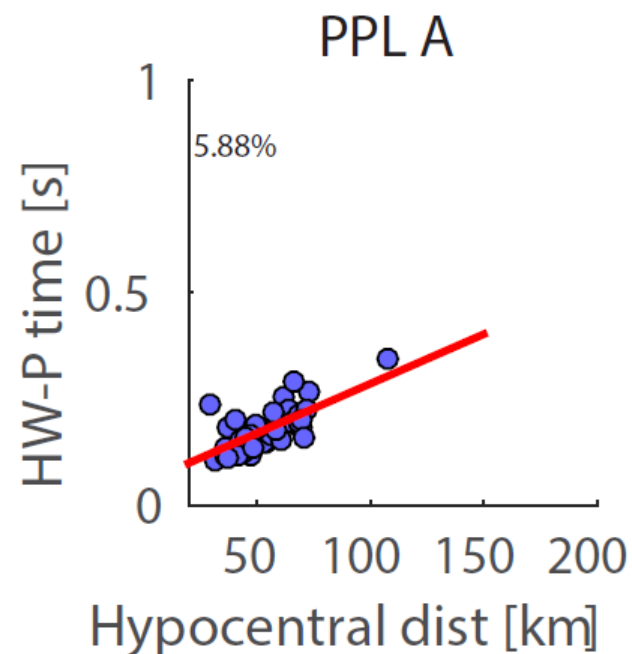

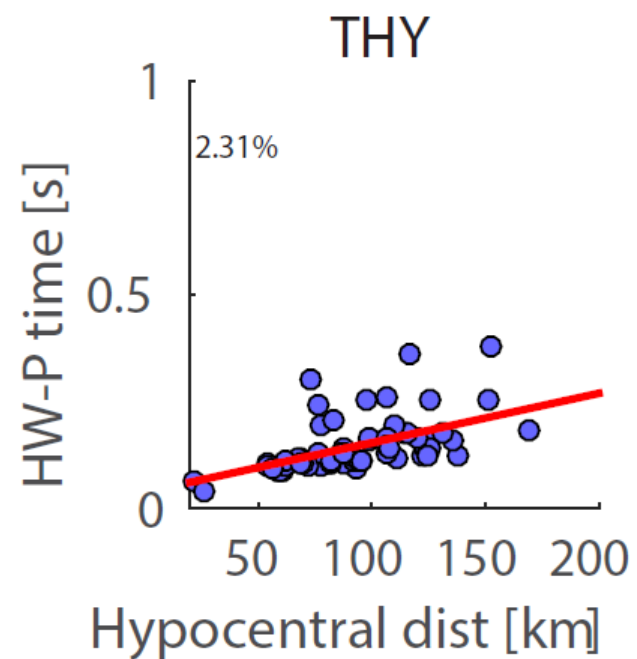

- Automated algorithm (Ross & Ben-Zion, 2015)
- 1,427 events
- Head waves detected at 15 stations
- Head waves on both sides of the fault!

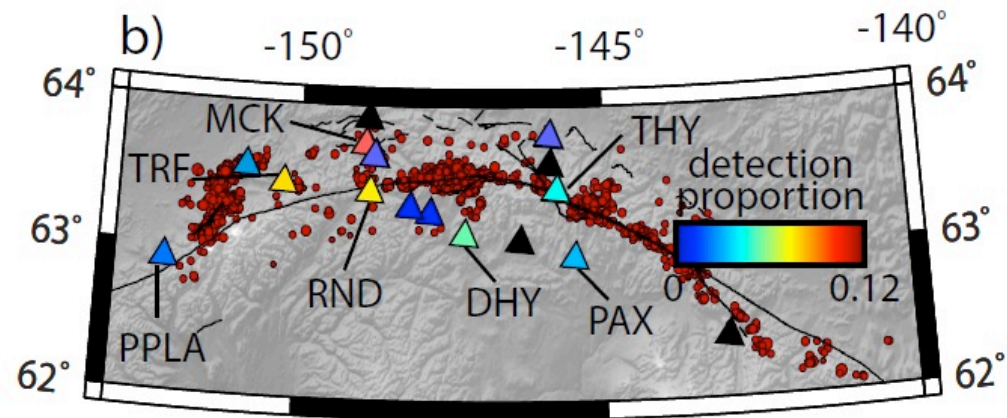

Head Wave Distance Distribution

- Northern stations have head waves from shorter distances
- Southern stations have head waves from further

Double-difference Tomography

Tomography of the Denali Fault

- 750,000 P wave arrivals
- 250,000 S wave arrivals
- 326 Stations

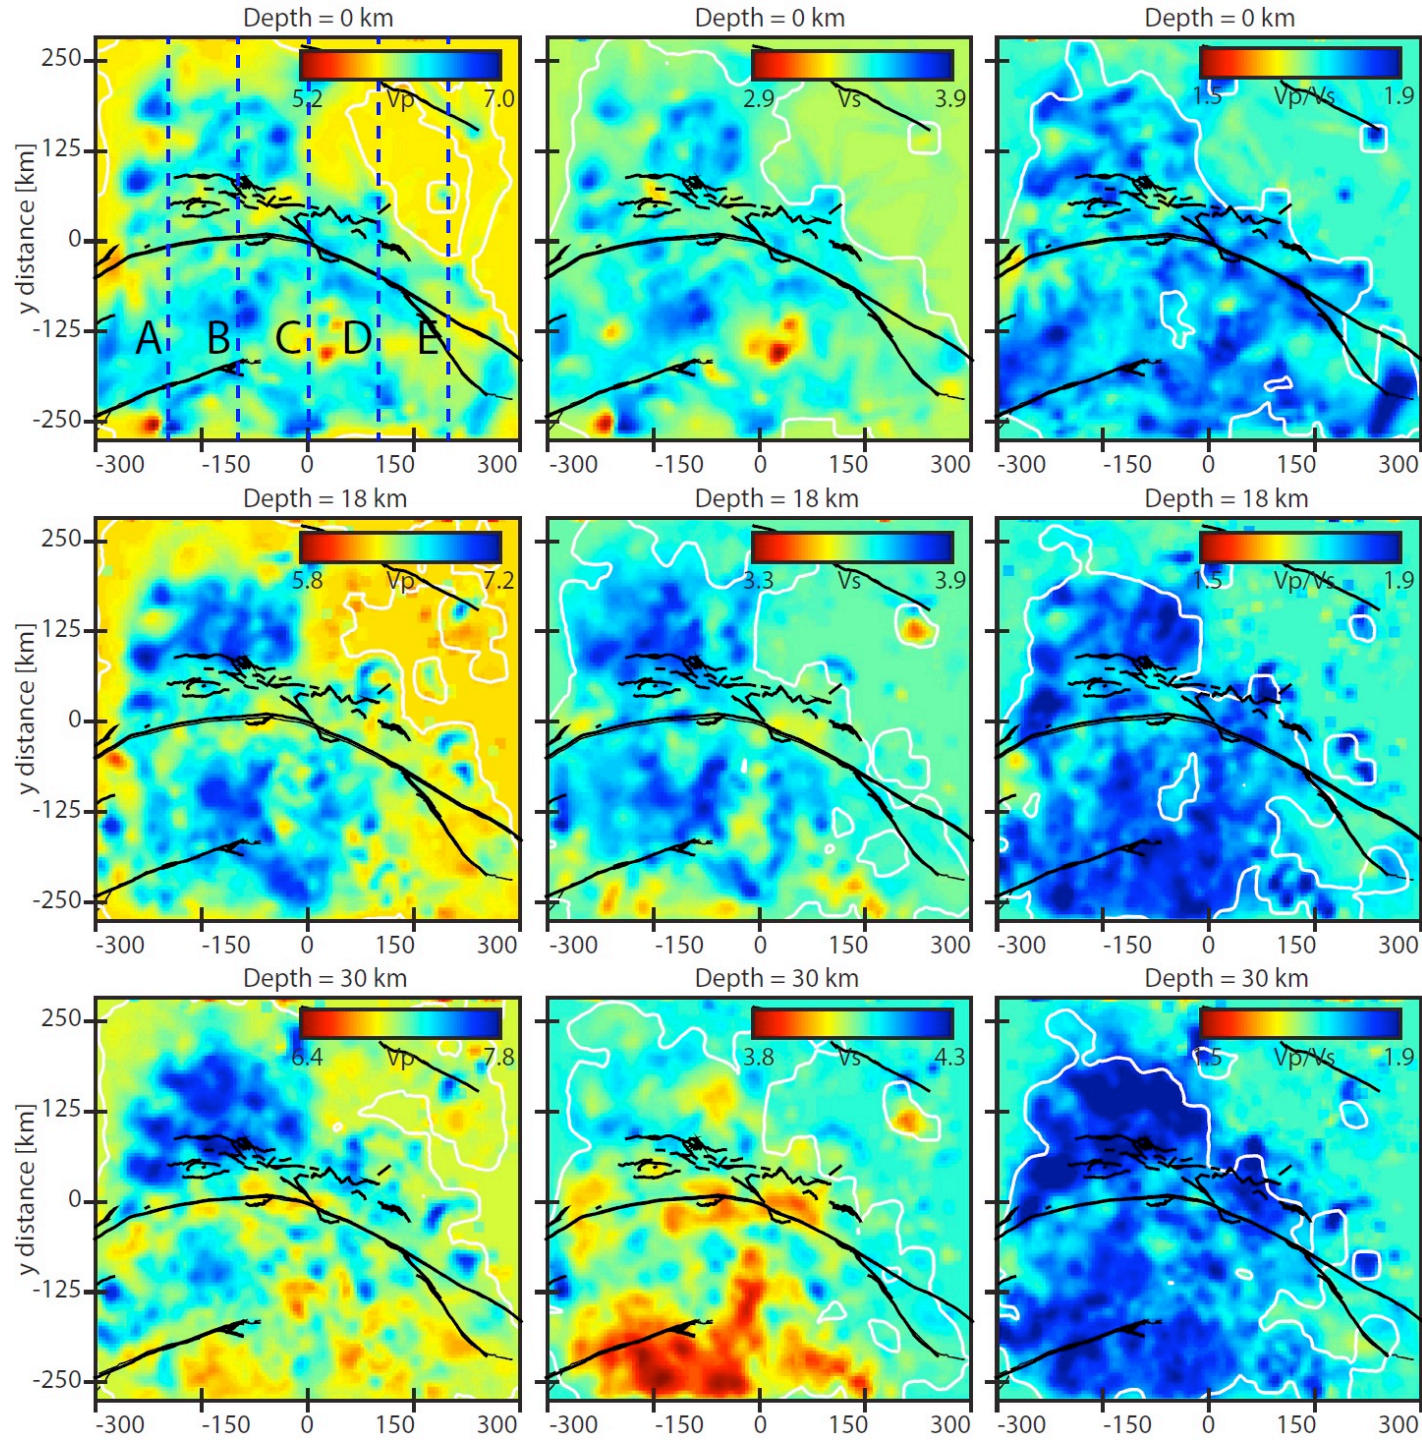

Source Location

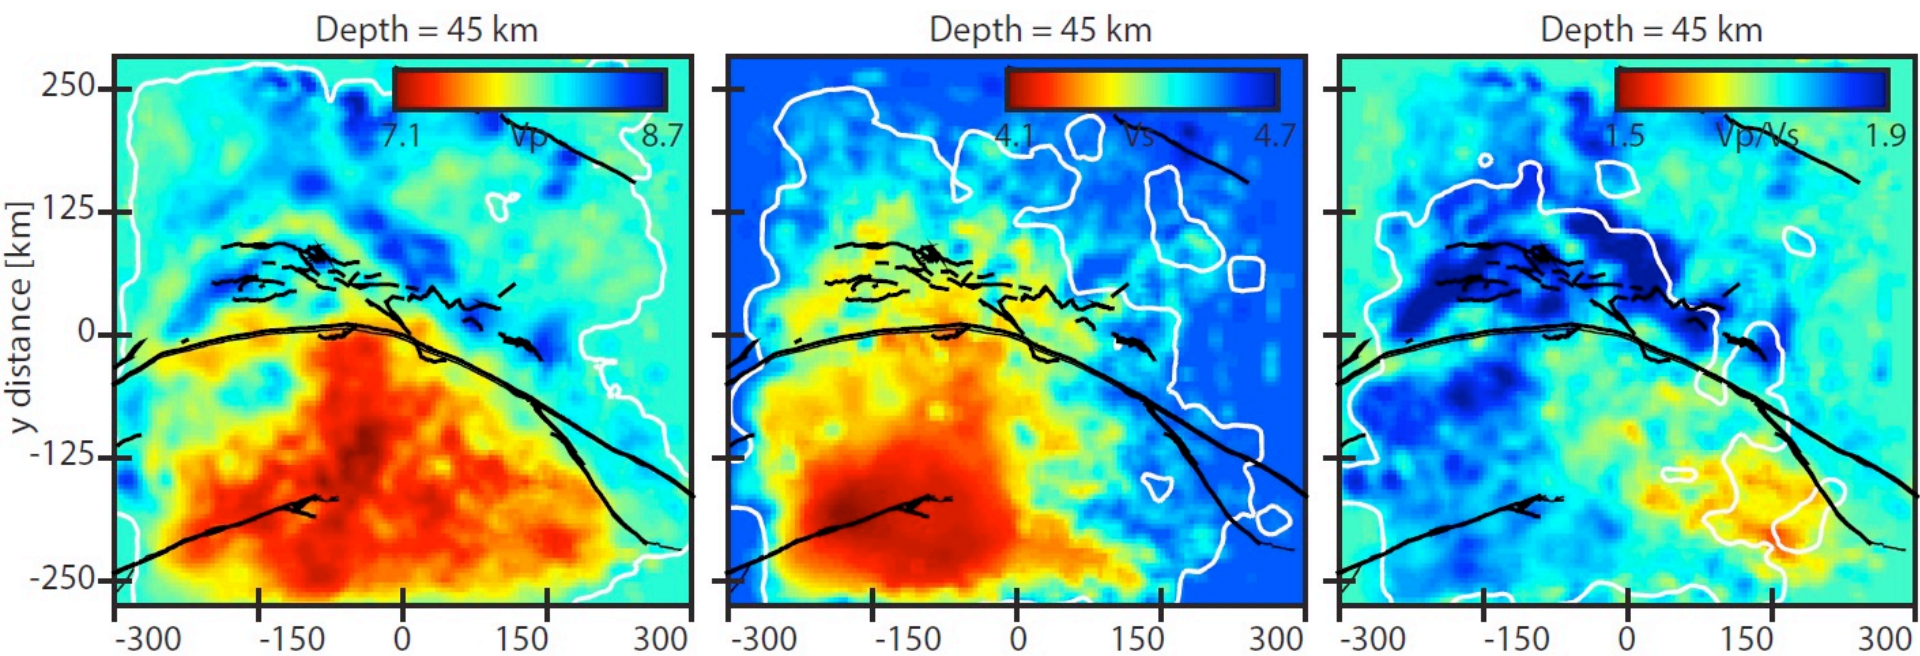

$$r_k^i = \sum_{l=1}^3 \frac{\partial T_k^i}{\partial x_l^i} \Delta x_l^i + \Delta \tau^i + \int_i^k \delta u \, ds.$$

Time

Structure

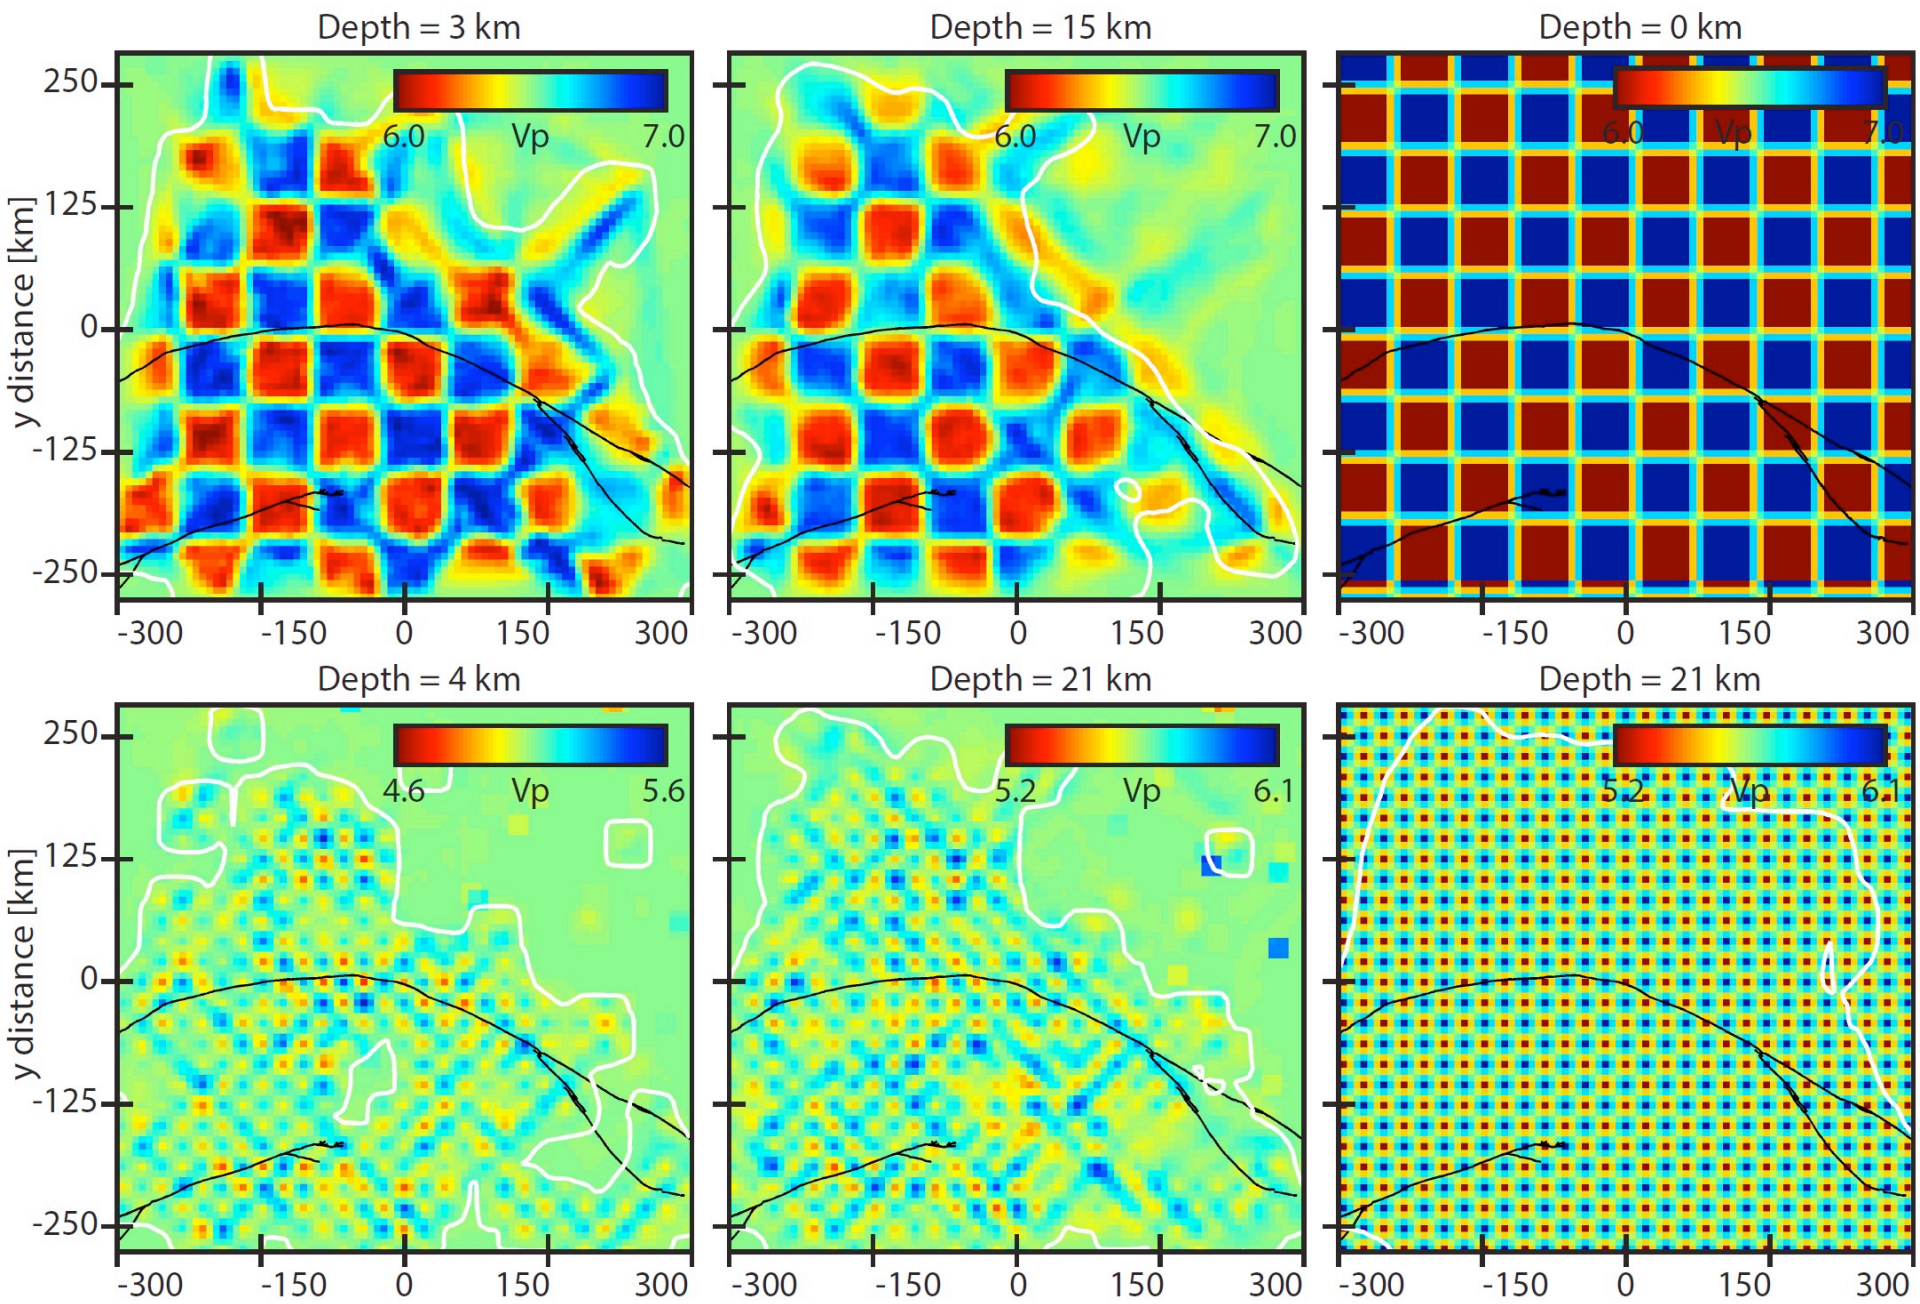

$$r_k^i - r_k^j = \sum_{l=1}^3 \frac{\partial T_k^i}{\partial x_l^i} \Delta x_l^i + \Delta \tau^i + \int_i^k \delta u \, ds - \sum_{l=1}^3 \frac{\partial T_k^j}{\partial x_l^j} \Delta x_l^j - \Delta \tau^j - \int_j^k \delta u \, ds.$$

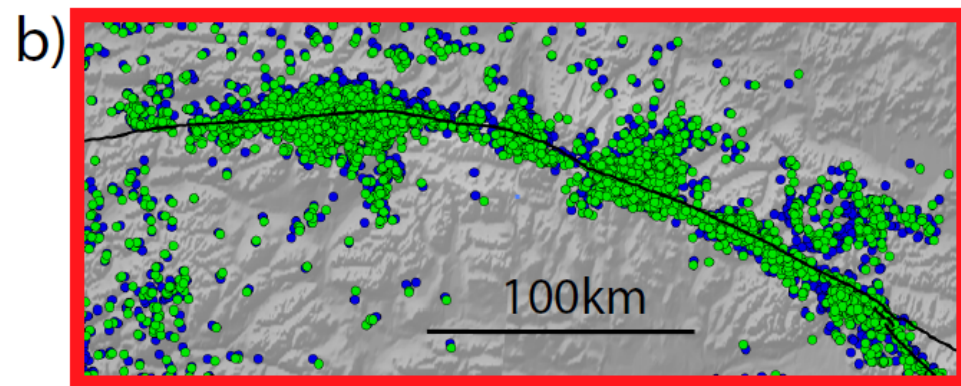

Checkerboard Tests

Earthquake Relocations

Receiver Functions

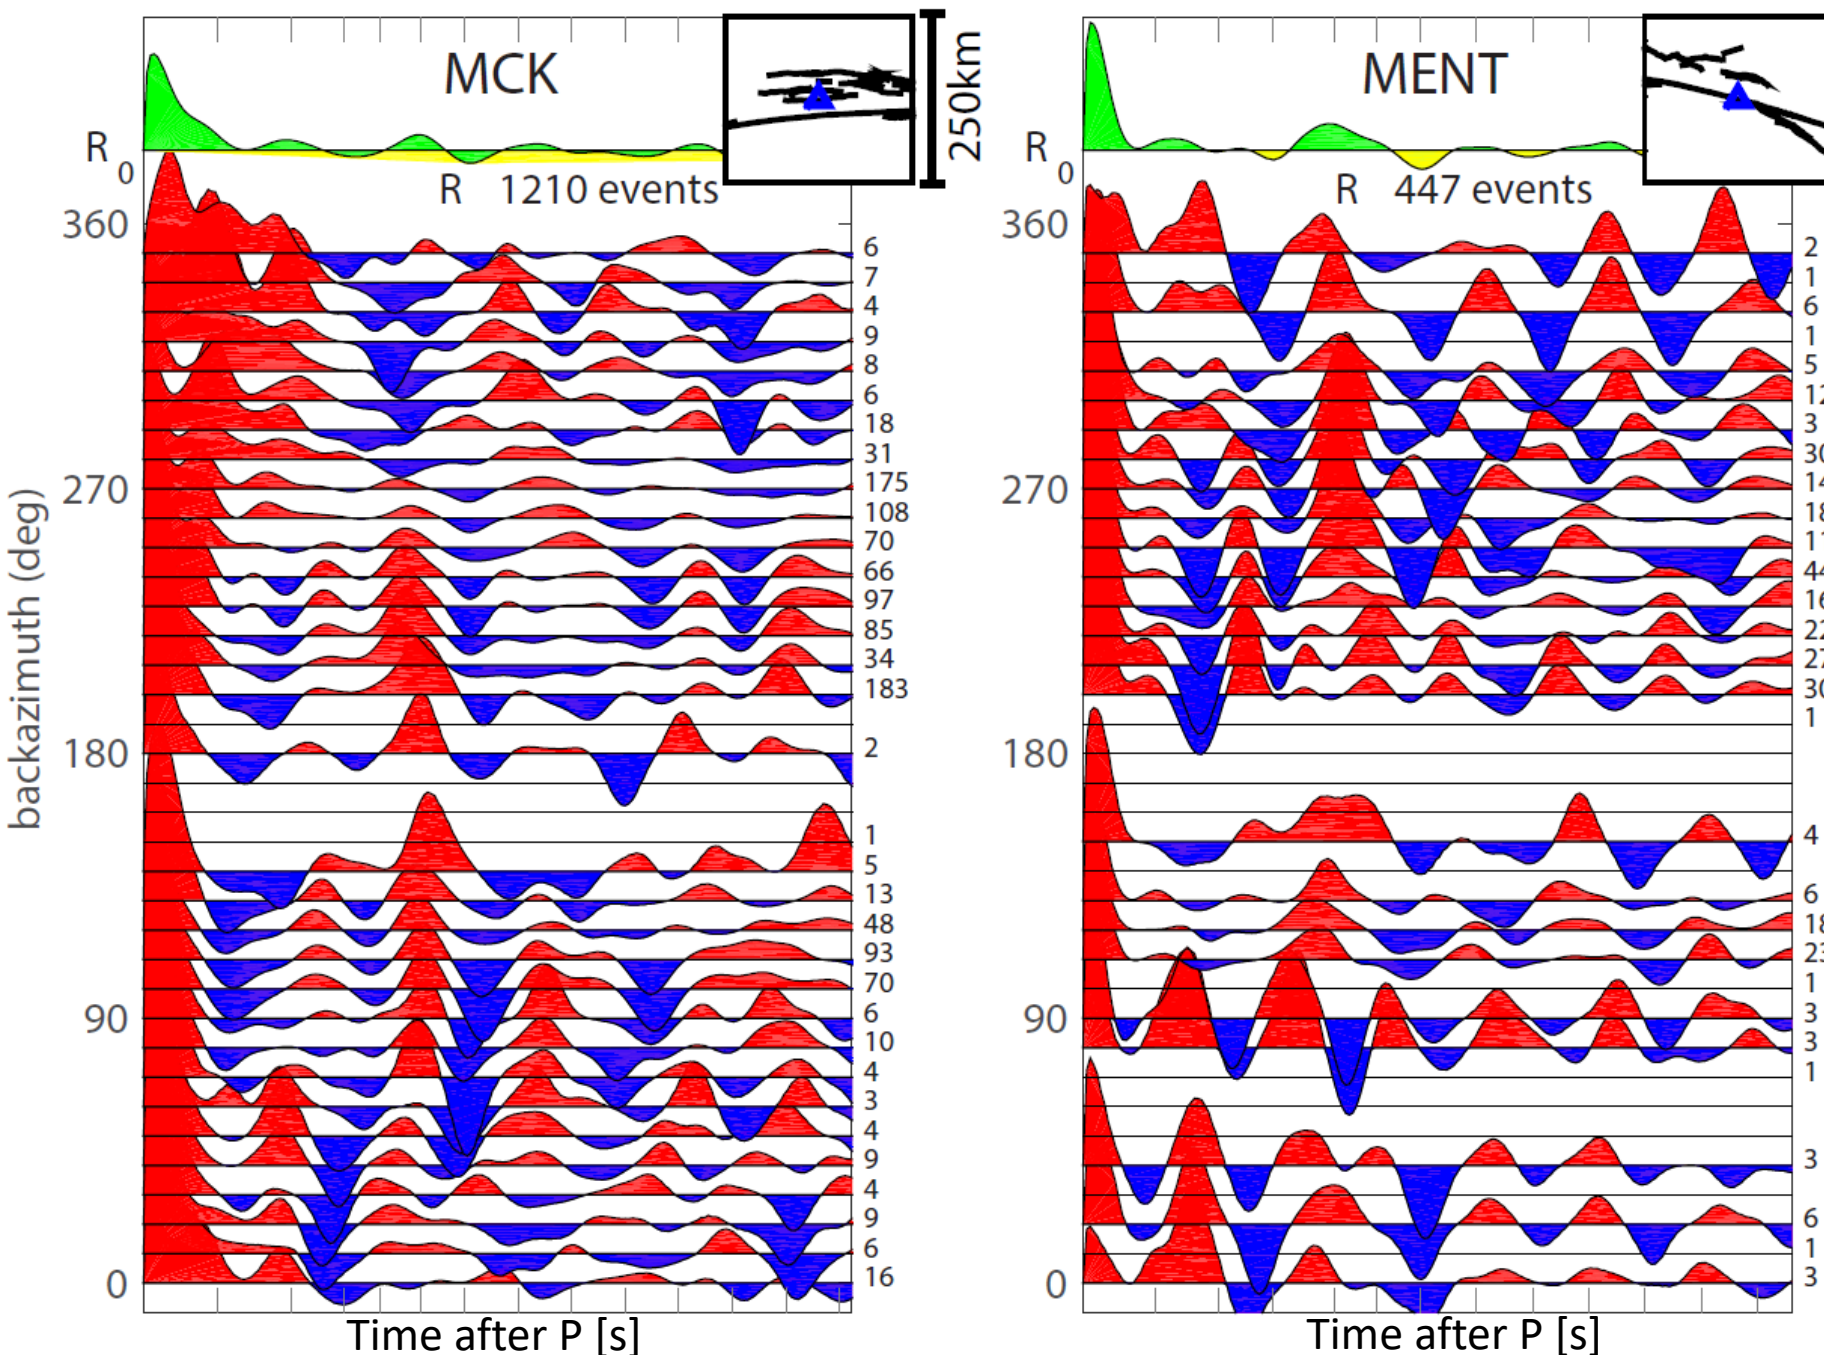

$$R(\omega) = \frac{U_R(\omega)}{U_V(\omega)}$$

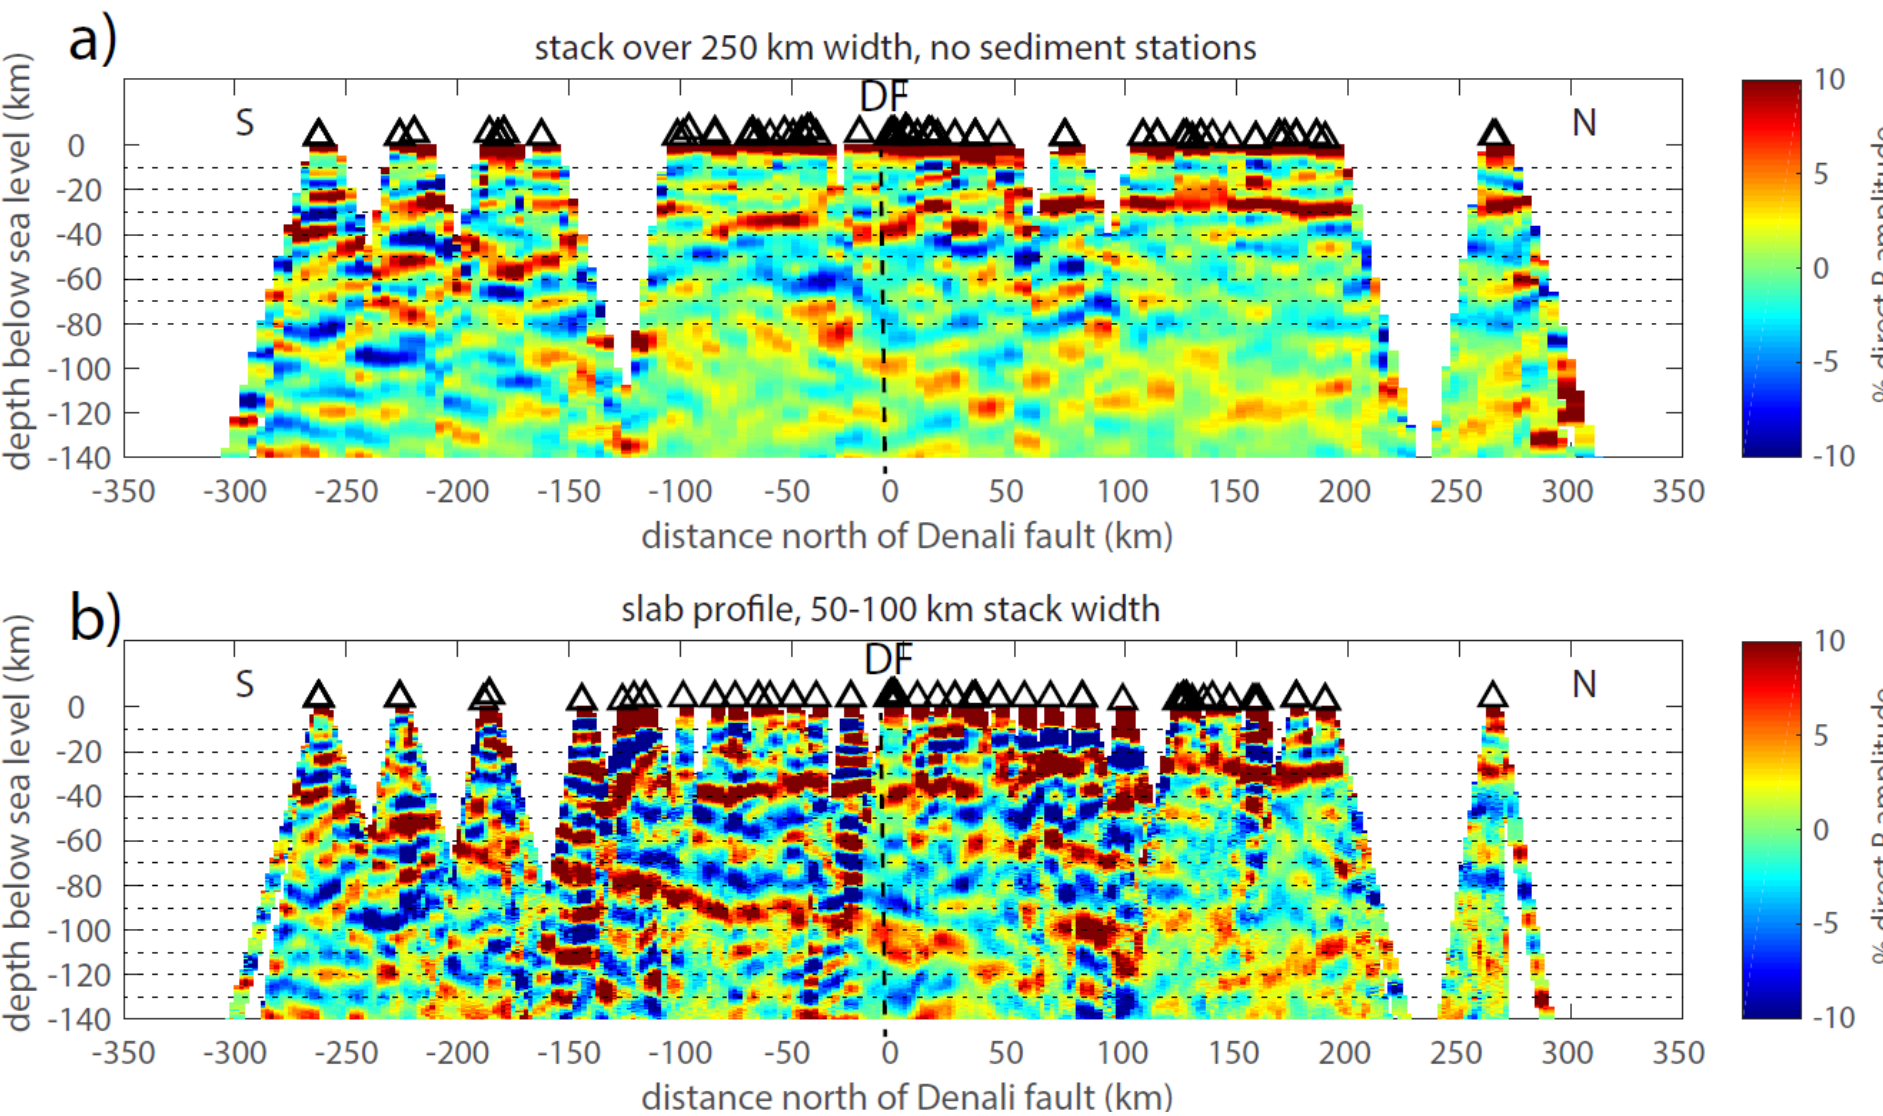

Vera Schulte-Pelkum

Receiver Functions

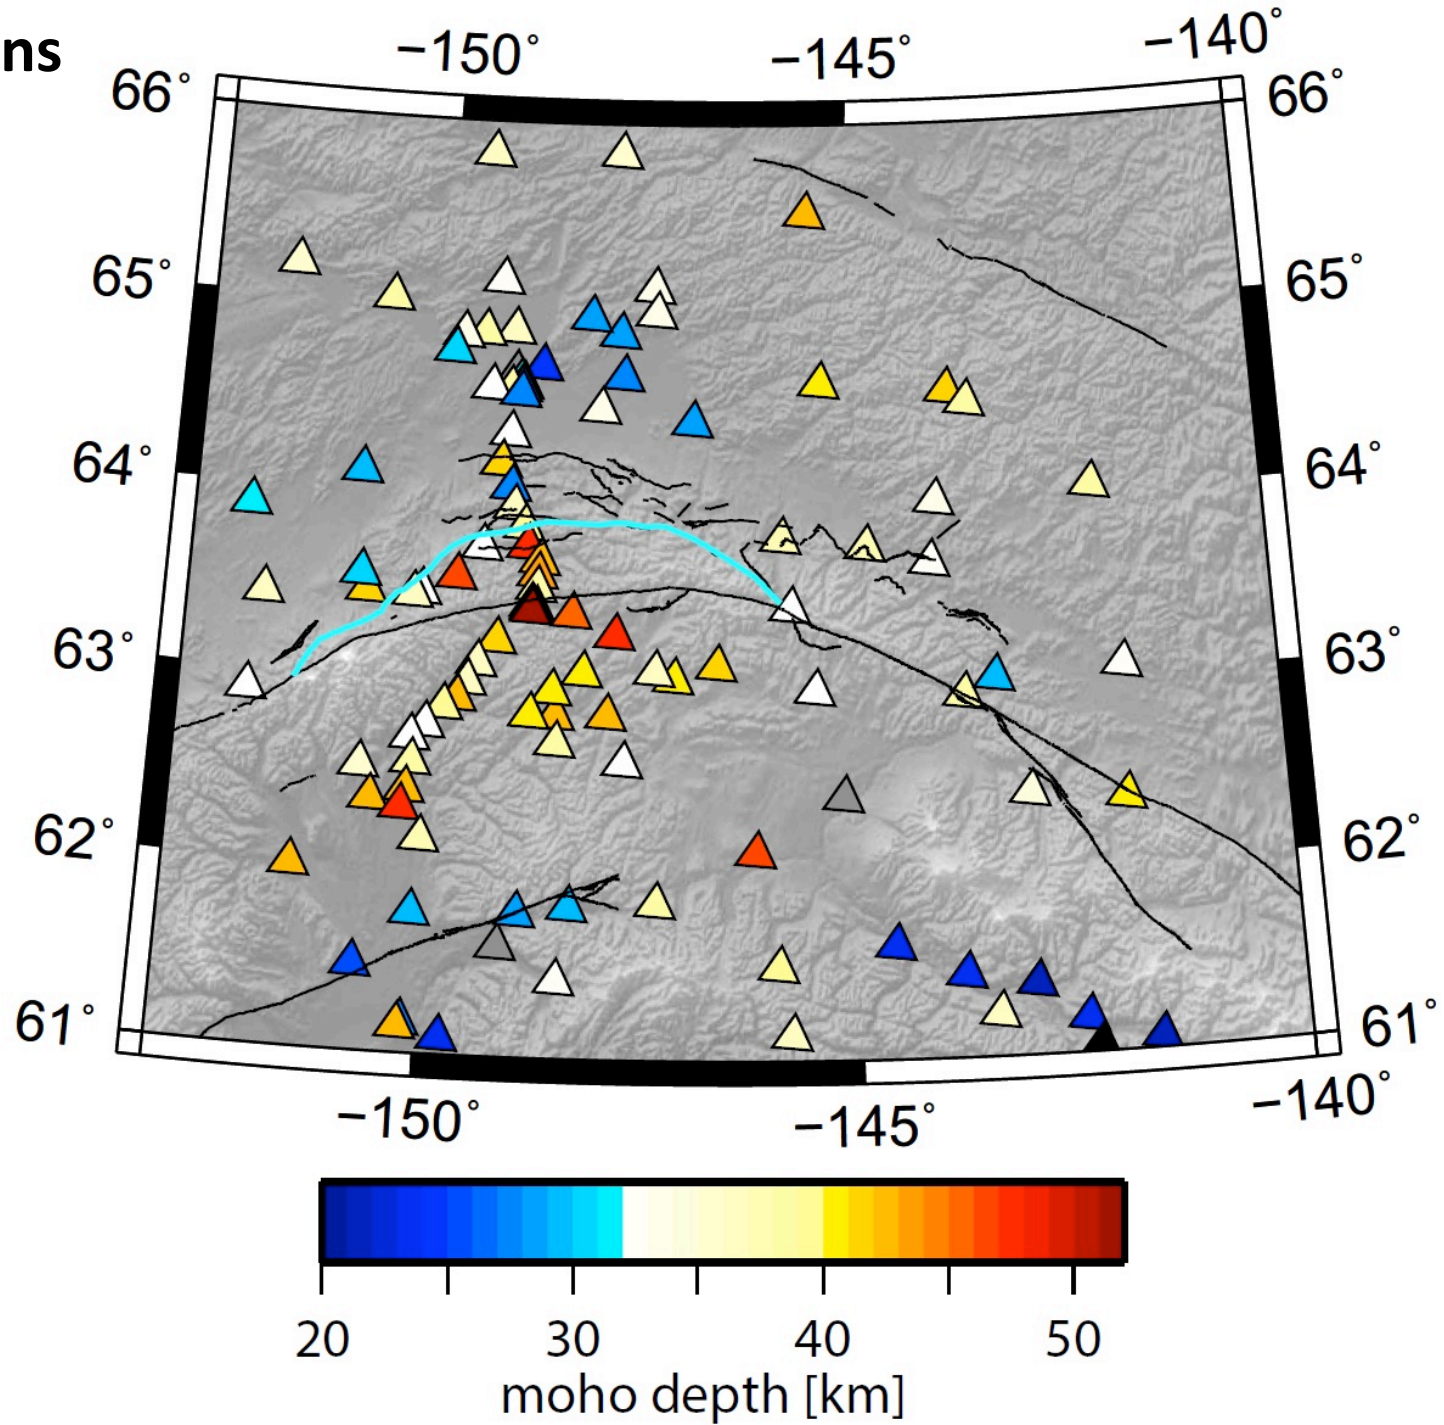

Receiver Functions – CCP Stack

Receiver Functions

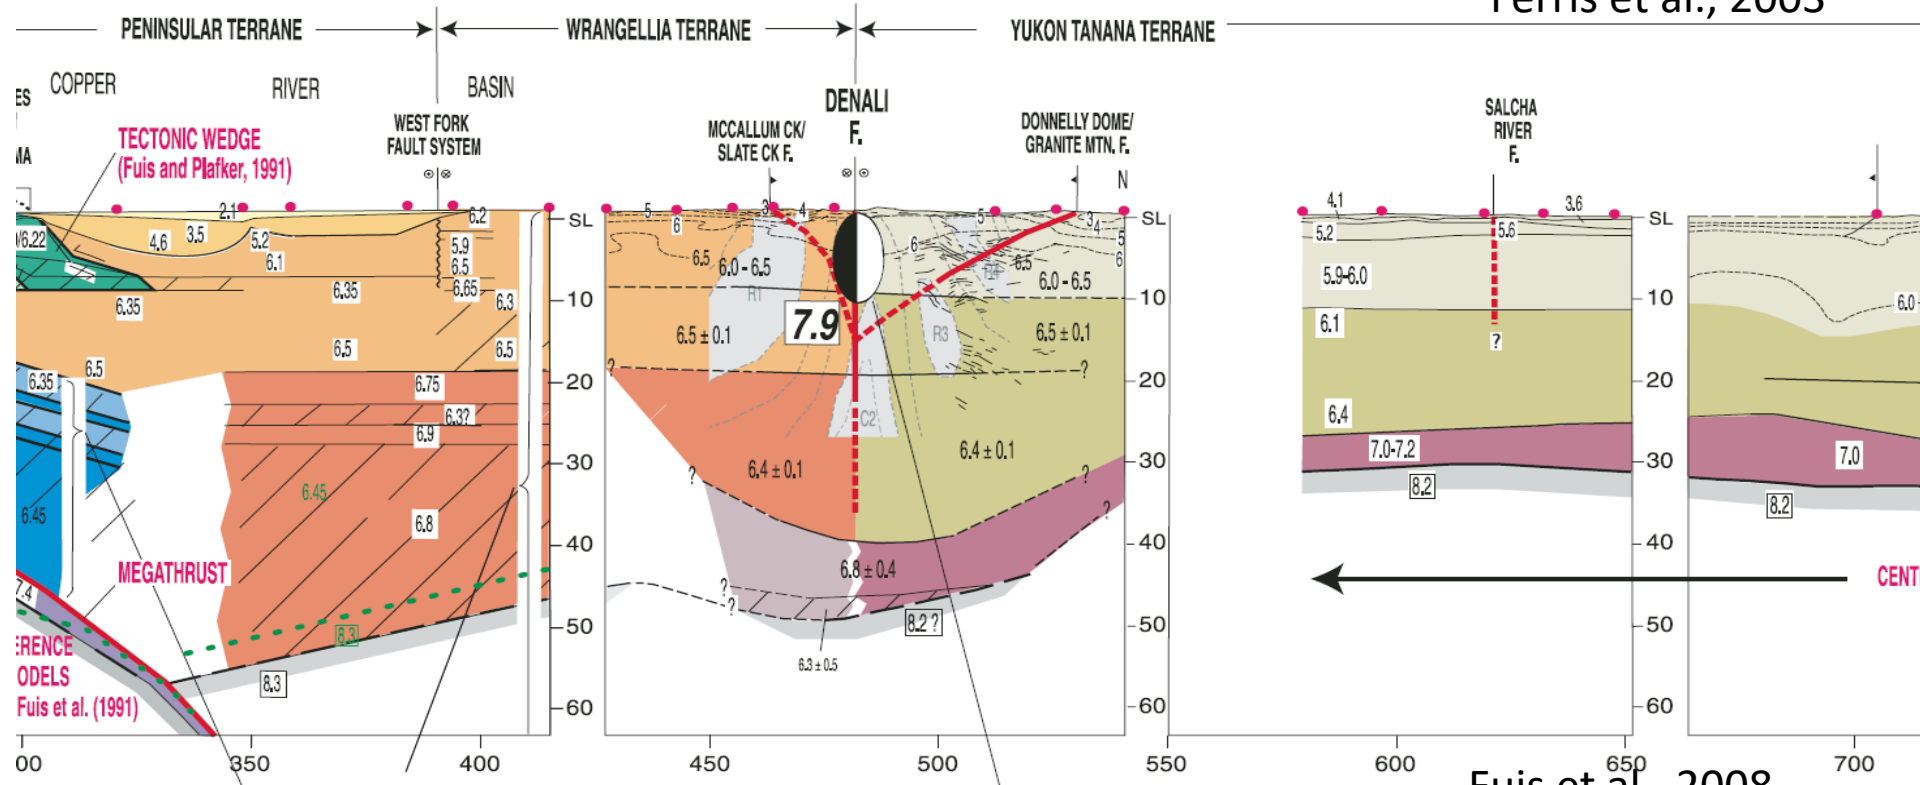

Moho Depth

Has the Moho offset been observed before?

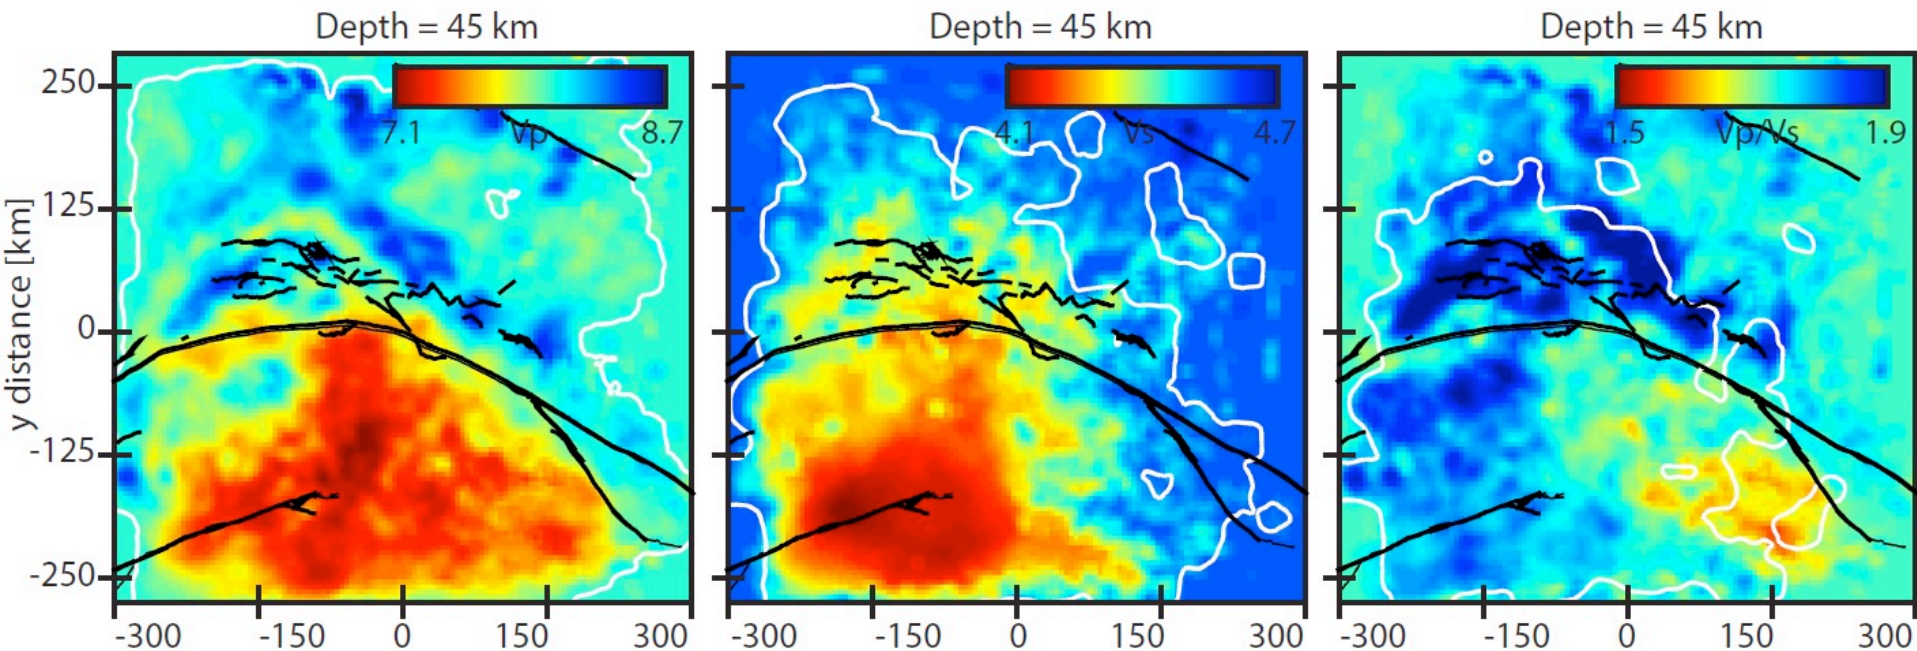

Ferris et al., 2003

Conclusions

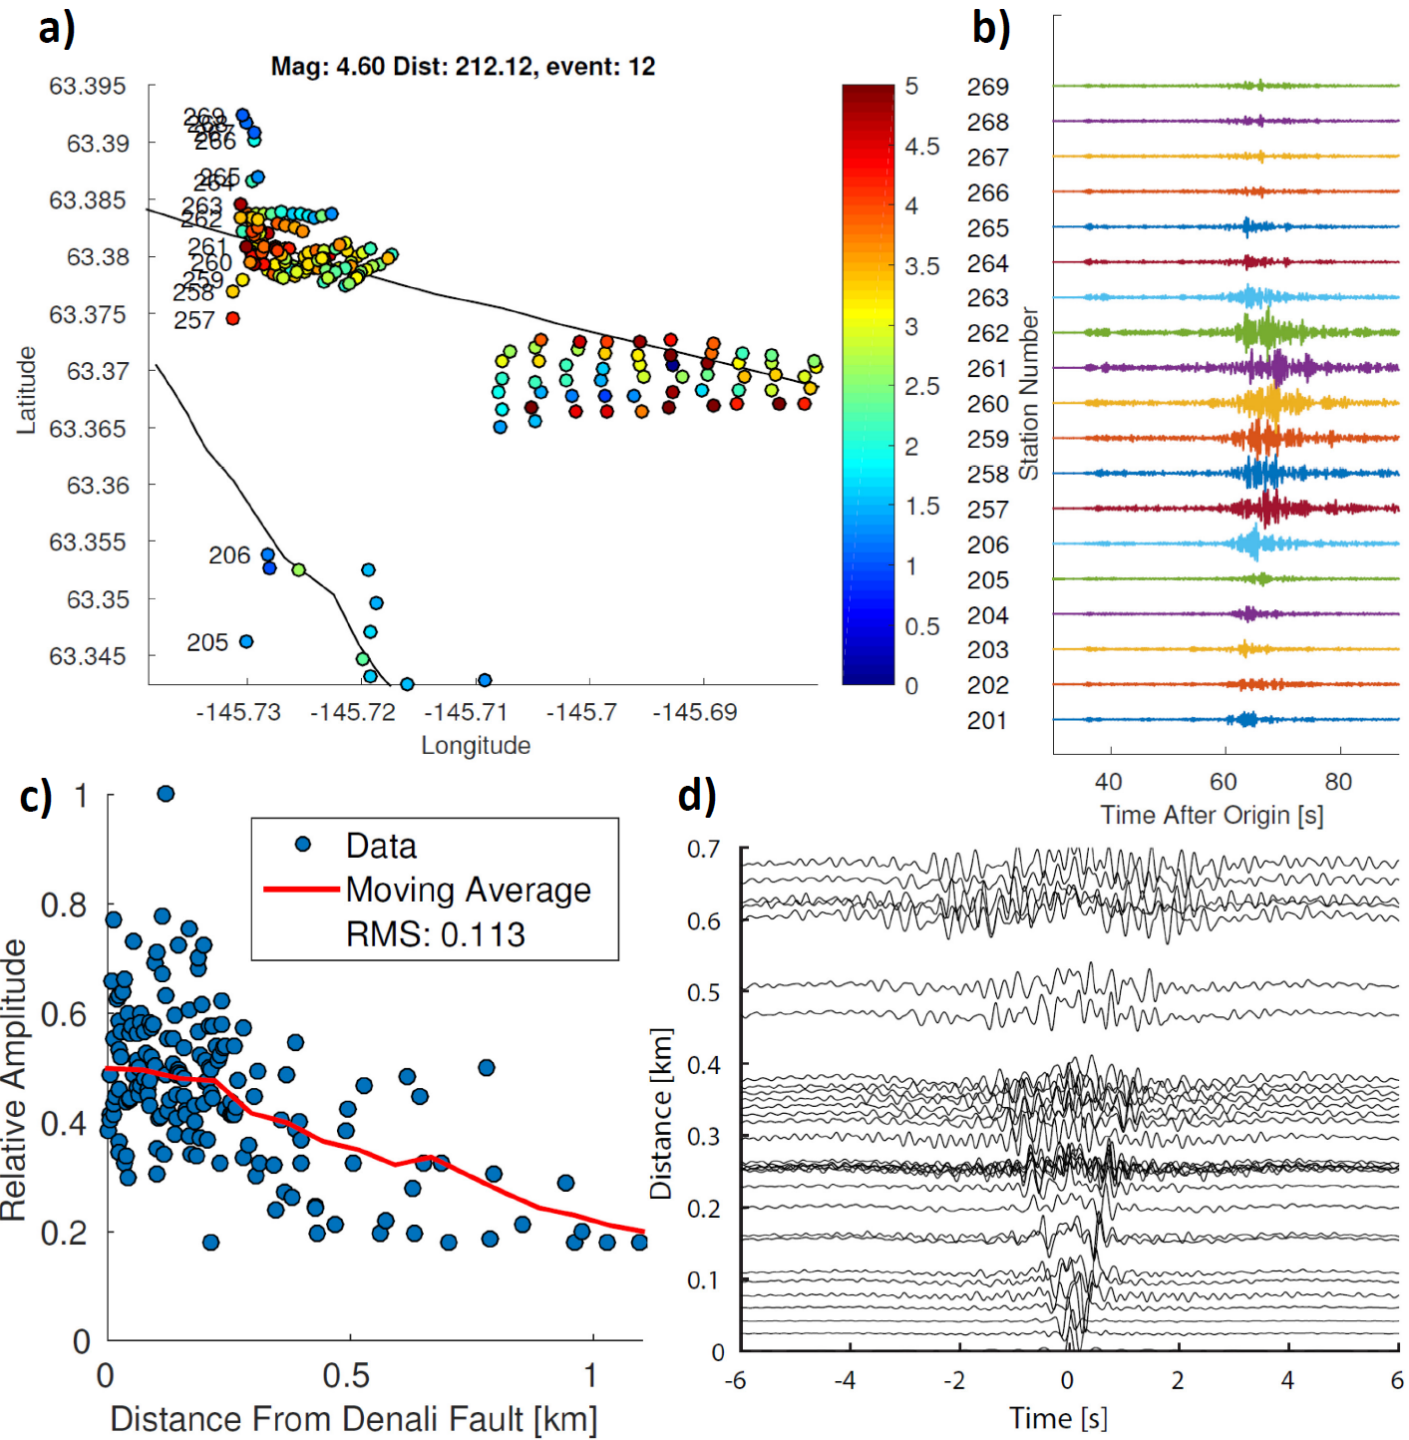

- There is a $\sim 15\text{km}$ vertical offset along the entire Denali Fault
- The north side is faster at depths $< 10\text{km}$, the south side is faster at depths $> 20\text{km}$
- The Denali fault separates two distinct crustal blocks with decoupled motion (plate boundary?)
